Triangles Proportionality & Similar Right Triangles

Parallel Line Similarity

A line parallel to one side of a triangle divides the other two sides proportionaly

The converse is also true.

Here's a picture:

$$\frac{AD}{DB} = \frac{CE}{EB}$$

$$\frac{4}{6} = \frac{2}{10}$$

$$\frac{4}{6} = \frac{2}{10}$$

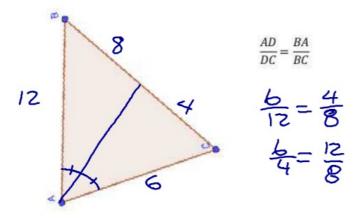

$$\frac{4}{6} = \frac{2}{10}$$

$$\frac{4}{10} = \frac{6}{10}$$

$$\frac{4}{10} = \frac{6}{10}$$

Angle Bisector Similarity
If one angle of a triangle is bisected, then the angle bisector of the triangle divides the opposite side into two segments that are propertional to the other two sides of the triangle.

Right Triangle Similarity

## Triangles Proportionality & Similar Right Triangles

An altitude of any right triangle splits the triangle into similar triangles. We end up with a small right triangle, a medium right triangle, and the original right triangle.

It may be easier to see the corresponding angles and sides if we pull the three triangles apart and draw them side by
